1. Outline of machine

1-1 Specifications (Model: KMA-5)

CAPACITY	
Working surface of table(length x width)	2700 x 750mm
Travel longitudinal x cross	2000 x 800mm
Vertical spindle head travel(vertical)	700mm
Vertical spindle nose to table top	70–770mm
Vertical spindle center to column front	800mm
TABLE	
T-slot (Wide x No. x Pitch)	18mm x 5 x 150mm
Table top to floor	900mm
SPINDLE HEAD	
Spindle Nose	ISO R297 No.50
Vertical spindle speeds	45-1500RPM (60Hz) Infinitely variable
Change of vertical spindle speed	Infinitely variable
Automatic Feeds (vertical spindle)	3~300mm/min
Feed	
Rapid traverse (longitudinal & cross)	3100mm/min
Feed rates (longitudinal & cross)	28–1000mm/min
Change of feed	Infinitely variable
MOTORS	
Vertical spindle	AC11kW (15HP)–4P
X & Y Axes feed (servo motor)	AC3.5kW
Z Axis feed (servo motor) (VERT. SPINDLE)	AC1.3kW
Lubrication	AC3.5W–2P
Cutting fluid	AC0.12kW(1/6HP)–2P
Machine size	
Floor space (longitudinal cross)	3710 x 3145mm
Machine height	2923mm
Net weight (Aprrox)	11800kgs
Standard color	Gray

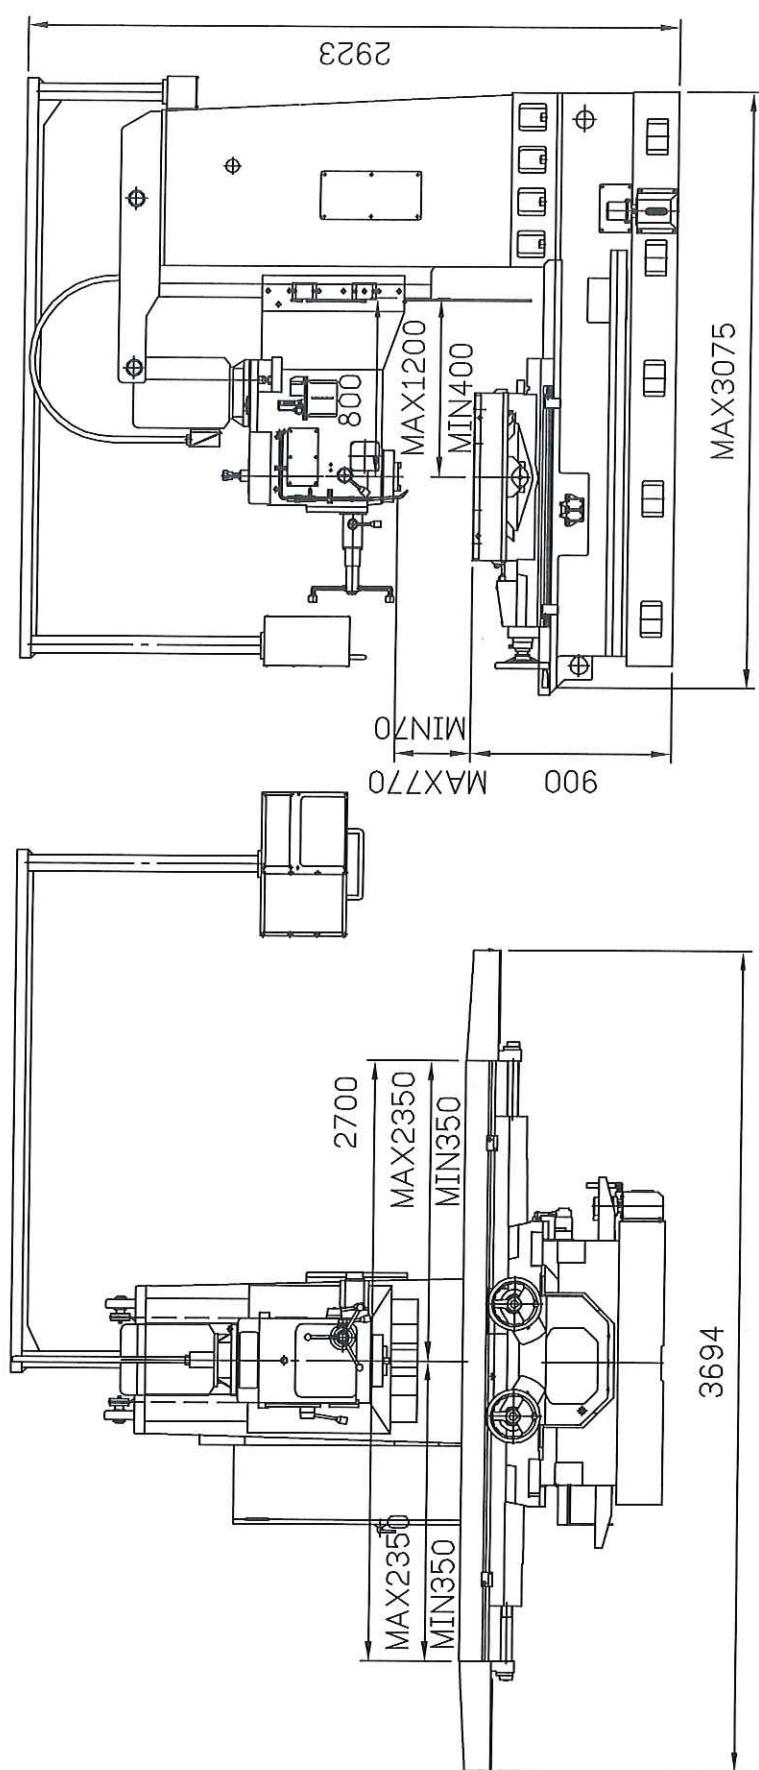

Standard Accessories:

1. Cutting fluid supply mechanism
2. Tools and box
3. Leveling blocks
4. Leveling bolts and nuts
5. Draw bar

Optional Accessories:

1. Digital scale
2. Power draw bar

13. Clamping device for vertical spindle head
14. Limit switch for saddle feed stop
15. Saddle
16. Lubrication pump for table and saddle sliding surface

Fig 5. The name of main parts

2. Installation of the machine

2-1 Transportation (Fig. 6)

Fix every part of the machine before hanging it. Especially pay attention to the fixation of spindle head and balancing weight (1). Put the balancing weight at the position of side of column by using the hand wheel for vertical spindle head rapid feed (2), Insert 2 shaft (8) for fixing balance weight.

Then use bolts (3) to fix balancing weight. Place the table to the middle position of machine , and move saddle close to the side of column. Move vertical spindle head upward, then insert the support bar (4) between table, hence the chain (6) is at loose condition. Both end of support bar should be cushioned with cloth or rubber to avoid damage of machine. Use steel rope to lift the machine shown on (Fig 6). Cloth or rubber should be cushioned between the rope and machine surface. Steel rope should not be touched the weak parts of the machine.

2-2 Loosening the clamping units of machine (Fig. 6)

After the transportation is completed. Loosen the clamping units of the machine and be careful to remove the support bar and to stretch the chain (6) slowly. At this time, check the chain whether contact the sprocket (7) tightly or not due to transportation. Before removal of support bar and the chain in good condition.

Move the spindle head upward for removing the support bar. Then move the spindle head downward slowly and smoothly until the chain is properly stretched.

NOTE: The chain can not stand impact load or it would be broken. Examine the chain in good condition once more, then loosen and remove the bolts (side window of column) for fixed balancing weight. But remember during spindle head downward before chain is stretched, the bolts of fixed balancing weight is absolutely not allowed to take out.

2-3 Leveling and Foundation (Fig. 7)

The machine can be located at 200mm thick concrete floor or set on 600mm thick concrete foundation , to ensure the accuracy of the machine and prevent cutting vibration. Shown on (Fig. 7) move the table to the middle position and clamp spindle head at the middle position of the column, then put the precision level (accuracy 0.02-0.05mm/1000mm) on the table to adjust the leveling of machine.

After finishing the leveling. Pour the concrete into the anchor bolt holes, tighten the bolt after the concrete is completed rigid, check the machine leveling once more, clean the machine base (sands & scraps etc.) then pour concrete between machine base and floor.

Fig 6. Method Of Lifting The Machine

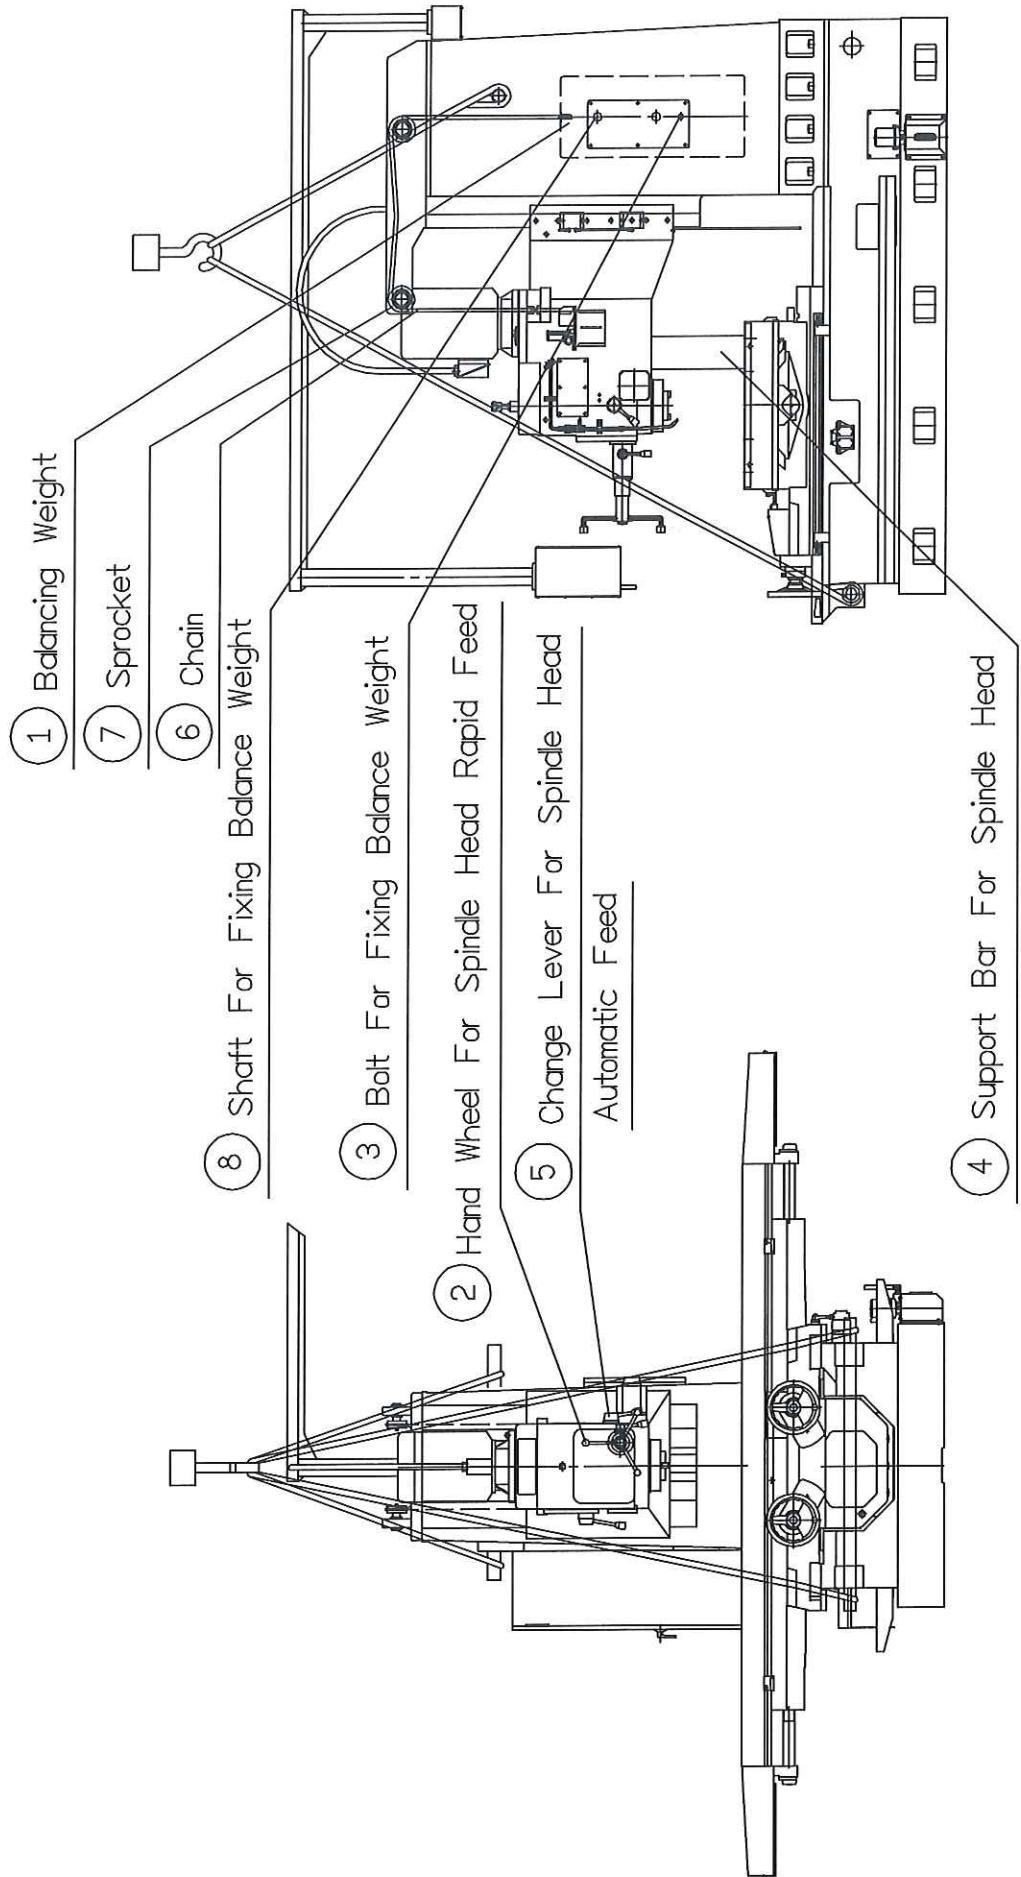

Fig. 7 Foundation drawing

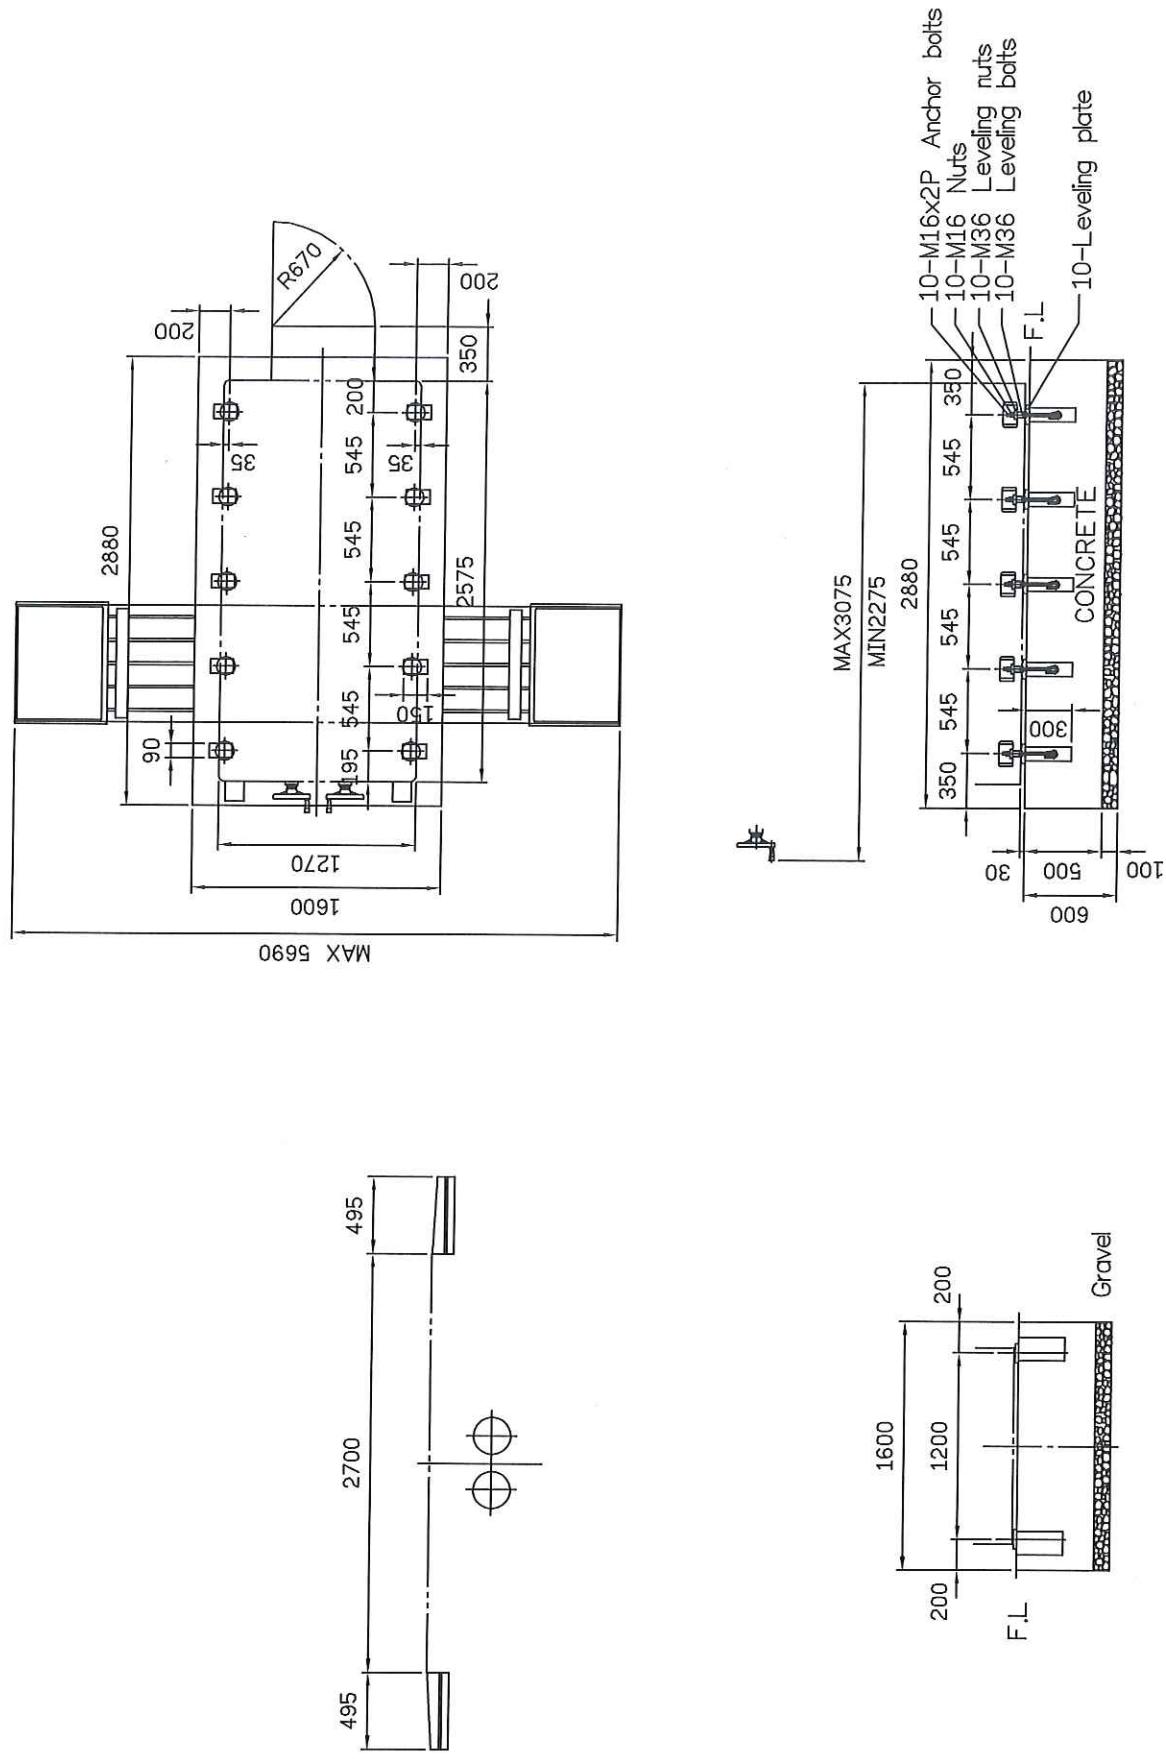

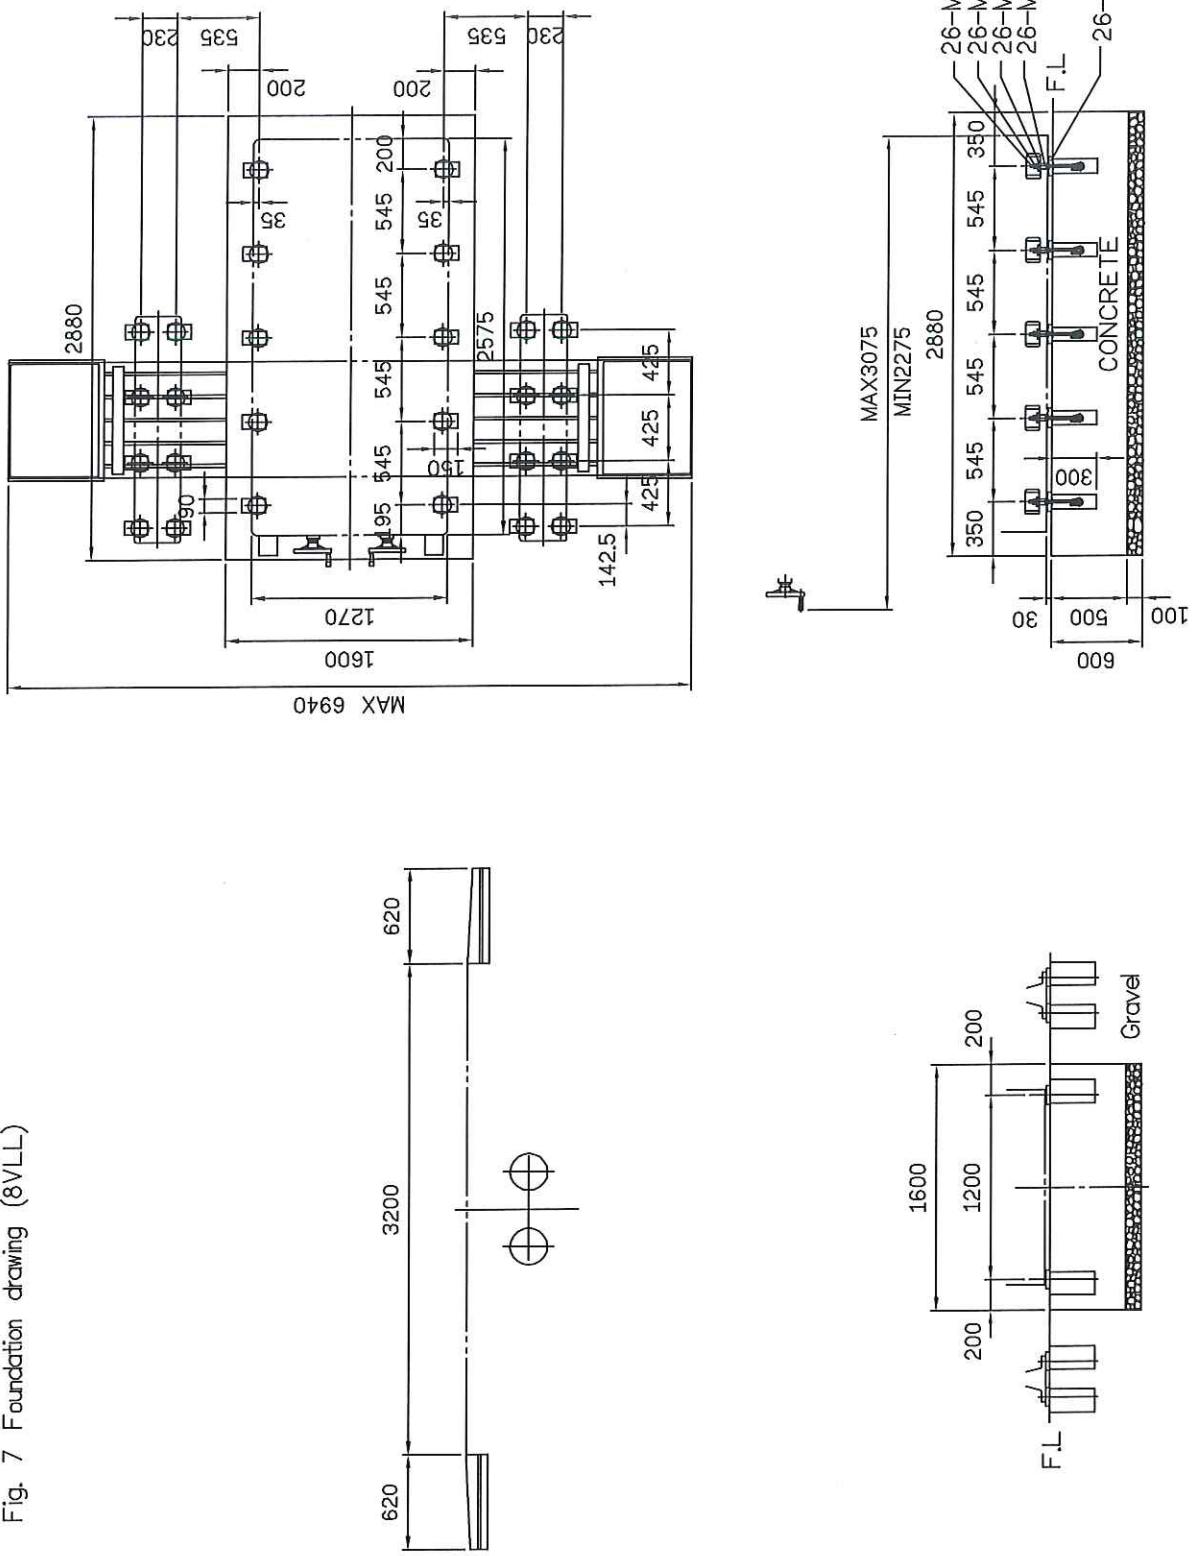

Fig. 7 Foundation drawing (8VLL)

2-4 Cleaning the machine

The machine is protected by grease or antirust oil before shipment. But the machine should be cleaned with gasoline before putting the protecting oil.

2-5 Removal of pad-bond coating agent.

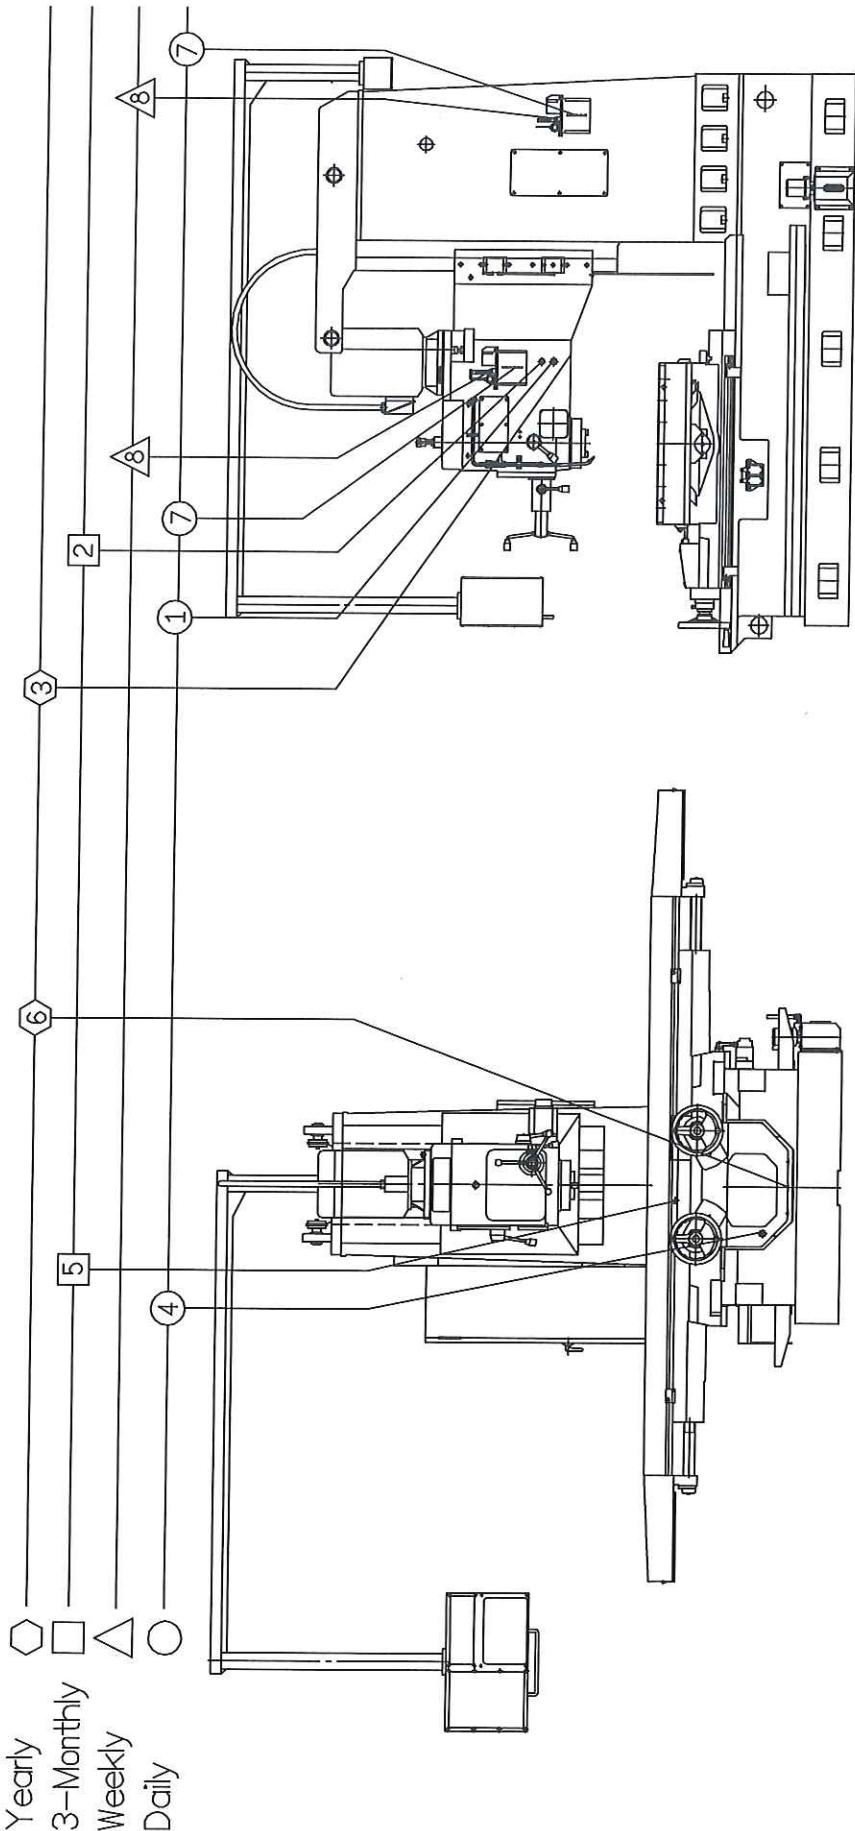

The covers should be applied with pad-bond coating agent if need be. During taking them apart and putting them together again, you should remove all of the used pad-bond coating agent and replace with new ones.

3 . Lubrication

3-1 Refer to (Fig.8) and table 3 & 4, check all of the lubricating portions of the machine which should be applied with suitable amount of oil in compliance with the regulation.

When the machine is in operation, inspect again all of the moving parts in good lubricating condition in order to ensure the superior function.

4. Cutting Fluid Pump Device (Fig. 9)

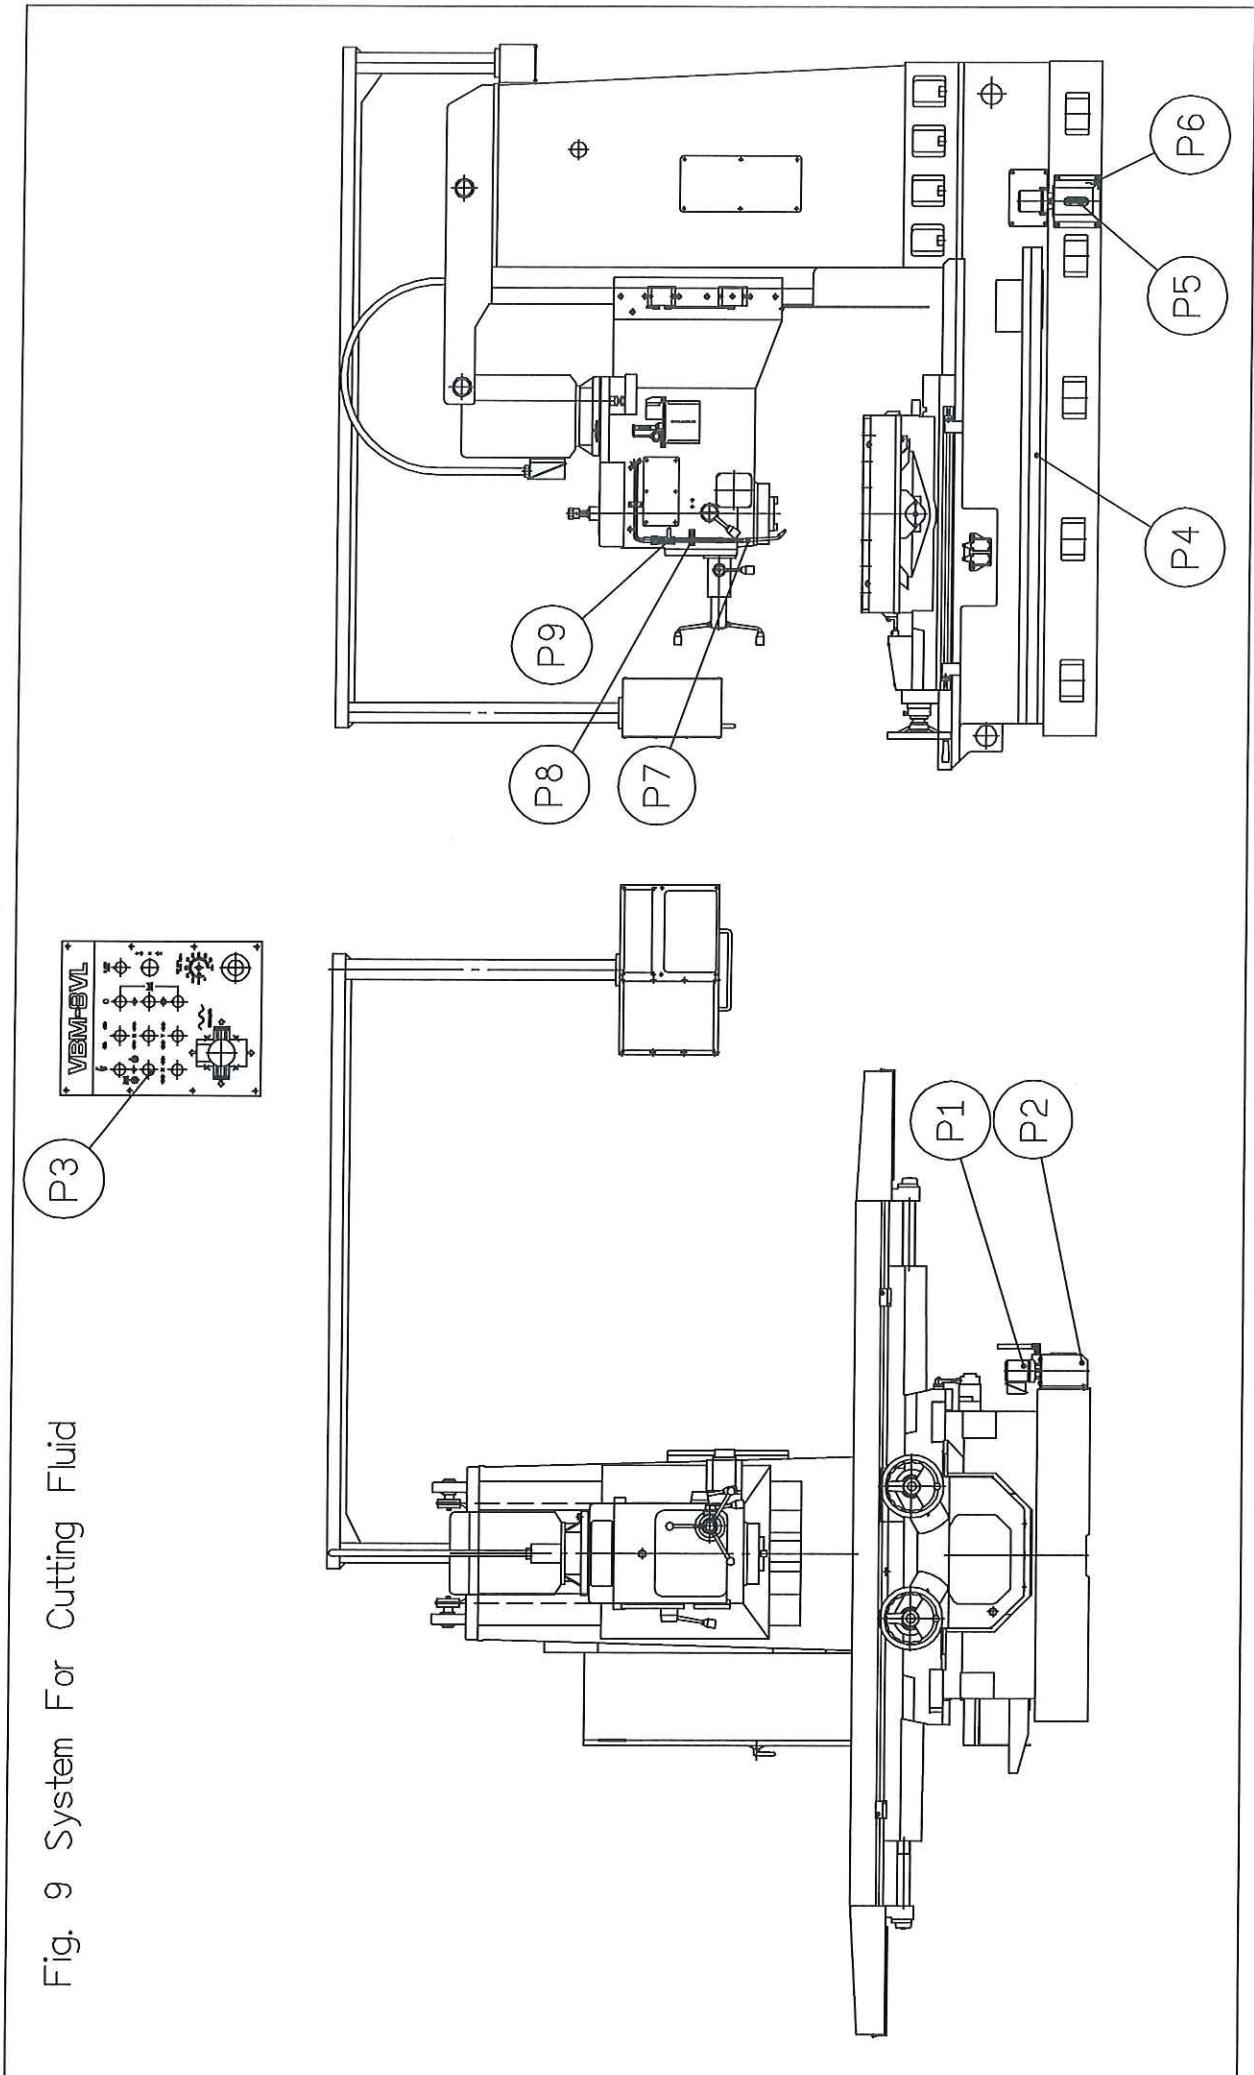

Cutting fluid pump (P1) located on the right side of the machine is operated by switch buttons (P3) on the operation panel. It will rotate in left position together with spindle, or rotate in right position by itself. Volume of cutting fluid is about 12 Gal, injected from pan (P4) until the gauge (P5) reaches the upper limit. Release the rotary plug to change the cutting fluid.

Cutting fluid nozzle (P7) is located on the right side of spindle head, held by nozzle clamer (P8).

The nozzle direction is adjustable and easy to take apart.

The injection quantity is controlled by a valve (P9), increased in counter-clockwise, and decreased in clockwise.

Fig. 9 System For Cutting Fluid

5. Operation

5-1. Preparation For Operation

Before operating the machine, check and prepare the following items. Items (1) and (2) are belonged to regular maintenance items.

- (1) Clean the dust or cutting scraps on each sliding surface and circumference and bore of spindle.
- (2) Inject oil to each sliding part according to the oil recommendation (Fig. 8 , Table 3 & 4), especially when the machine turned off for a long period.
- (3) Connect the power source (380V , 50HZ) to R.S.T terminals board of electrical cabinet according to the wiring diagram.
- (4) Turn on the no-fuse breaker. The pilot lamps of operation panel will be lit up when the current is conducted.

5-2. Operation Of Vertical Spindle (Fig. 10)

Before operating the spindle, check the clamp of the spindle head switch (S11), and rotate to unclamp position (Fig. 10). (A) Rapid Feed Of Spindle Head (by hand) Engage the vertical spindle head manual or automatic feed change lever (H6) in "A" position for manual feed, then turn the hand wheel (H7) of spindle head rapid feed to clockwise to move spindle head downward and to counter-clockwise to move it upward.

The spindle head will move 30mm in each revolution.

(B) The Start And Stop Of Spindle

The spindle will be started or stopped by switches (S4),(S5) and (S6). (S4) is starting switch, (S6) is inching switch, and (S5) is stopping switch. Starting switch (S4) can only be operated when everything go right. Operate (S5) to stop the spindle.

In emergency case, it is also possible to operate the emergency switch (S9) on operation panel to stop the machine.

(C) Rotating Speed Change of Vertical Spindle

Spindle rotation speed can be changed by operating high-low change lever (H3). Then turn the knob (S16) increase or decrease spindle speed.

There are infinitely variable change speed as shown in specification. Do not operate the lever when the spindle is in rotation. It can be operated only when the spindle is stopped.

If the spindle is rotated manually, the high-low change lever should be placed in the middle position.

(D) Automatic Feed Of Vertical Spindle Head

The spindle head automatically feed can be operate spindle head manual or automatic feed change lever (H6). Lever(H6) will set "A" direction for manual feed and push lever to "B" direction for automatic feed. Push the switch (S14) up the spindle head will move upward, push the switch (S14) down the spindle head will move downward and push the button (S13) will move rapid feed. Turn the knob (S15) increase or decrease spindle head (Z axis) feed.

5-3. Operation Of Table And Saddle (Fig. 11)

Before operation, rotate the table clamping switch (Fig.11) (S12), saddle clamping switch (Fig. 11) (S10) on the operation panel to unclamp position.

(A) Hand Feed Of Table And Saddle

Push the table feed hand wheel (E1) to mesh clutch for rotation. It will move the table to right in clockwise, and left in counterclockwise.

Push the saddle feed hand wheel (E2) to mesh clutch for rotation. It will move the saddle to backward in clockwise, and forward in counterclockwise. Hand wheel will move forward or backward 6mm in each revolution. Each hand wheel has 0.025mm scale knob (E7), (E8) When scale knob is calibrated to the positive zero and the set screw is fixed, the reading represents the displacement.

(B) Starting And Stopping Operation Of Table Automatic Feed

Check the proper operation of the table feed stop block (D3), (D4) and table feed limit switches (Li1), (Li2) and saddle feed stop block (D5), (D6) and saddle feed limit switches (Li3), (Li4).

Adjust and fix the feed stop block (D3), (D4) or (D5), (D6) on the desired position. When starting switch (S8) on the operation panel moving to right, left, forward or backward, the table will move to right, left, forward or backward. If the starting switch (S8) is in neutral position, the table will stop feeding.

Besides, the table will be stopped also by table feed stop block (D3), (D4) contact limit switch (Li1) (Li2), and saddle feed stop block (D5), (D6) contact the limit switches (Li3),(Li4).

In case of emergency , press the emergency stop switch (S9), all of the power are shut down.

(C) Automatic Feed Speed Change Of Table

Automatic feed speed of table can be adjusted by control knob (S7), increase feeding in clockwise, and decrease feeding in counterclockwise. Operator can adjust the knob to a satisfied feed speed based on the actual situation. The knob is scaled in mm/min.

(D) Automatic Feed Direction Of Table

Automatic feed of table in this machine is controlled by switch (S8). Its feed direction is the same as switch direction, right, left, forward, backward.

(E) Table Rapid Feeding

Table rapid feeding is also controlled by switch (S8) press the button and push to operate in the direction based on actual requirements. Rapid feed speed is 3100mm/min.

(F) Automatic Feed Stop

Left-right direction elbow (D3), (D4) and back-forth direction elbow block (D5), (D6) must fixed exact position.

F-1. Stop The Feed Of Table Moving Toward To Left Side

When the elbow block (D3) devices on the right side in front of table touch the limited switch (Li1), the electrical circuit of feed motor will be interrupted and the movement of table will stop at once. At this time, if the switch (S8) is operated to "B" direction the motor will be started in reverse direction.

F-2. Stop The Feed Of Table Moving Toward To Right Side

When the elbow block (D4) devices on the left side in front of table touch the limited switch (Li2), the electrical circuit of feed motor will be interrupted, and the movement of table will stop at once. At this time, if the switch (S8) is operated to "A" direction the motor will be started in reverse direction.

F-3. Stop The Feed Of Saddle Moving Toward to Forward

When the elbow block (D6) devices on the rear side in right side of saddle touch the limited switch (Li4) the electrical circuit of feed motor will be interrupted, and the movement of saddle will stop at once. At this time, if the switch (S8) is operated to "C" direction, the motor will be started in reverse direction.

F-4. Stop The Feed Of Saddle Moving Toward To Backward

When the elbow block (D5) devices on the front side in right side of saddle touch the limited switch (Li3) the electrical circuit of feed motor will be interrupted, and the movement of saddle will stop at once. At this time, if the switch (S8) is operated to "D" direction, the motor will be started in reverse direction.

(G) Identification On Automatic Feed Stop

After the feed is stopped in each direction, if it is necessary to restart the feed at the same direction, please process in manual operation. Automatic feed stop in each direction will be effective either on cutting feeding or rapid feeding.

If the elbow block and limit switch are under the following status, the switch (S8) has no action at all. So the motor in speed change box will be not started.

- (1) (D3), (Li1) and (D5), (Li3) operating same time.
- (2) (D4), (Li2) and (D6), (Li4) operating same time.

In above function , the elbow block and limit switch will be released by hand feed. When automatic feed is stopped, the switch (S8) must be place in neutral position. When it is turned on again or power turned on and signal processed, the motor must be started according to the switch (S8) direction .

6. Clamping Devices

In order to maintain better finishing and accurate surface, the following portions should be clamped tightly before cutting operation.

6-1. Vertical Spindle Head Clamping (Fig. 10)

The clamping of spindle head should turn the clamping switch (S11) to right for clamping and turn to left side for unclamping.

6-2. Table clamping (Fig. 10)

The clamping of table should turn the clamping switch (S12) (In the case of boring or drilling operation) to right for clamping and turn to left side for unclamping.

6-3. Saddle Clamping (Fig. 10)

The clamping of saddle should turn the clampingswitch (S10) to right side for clamping and turn to left side for unclamping.

Fig. 10 Operation Of Vertical Spindle Head

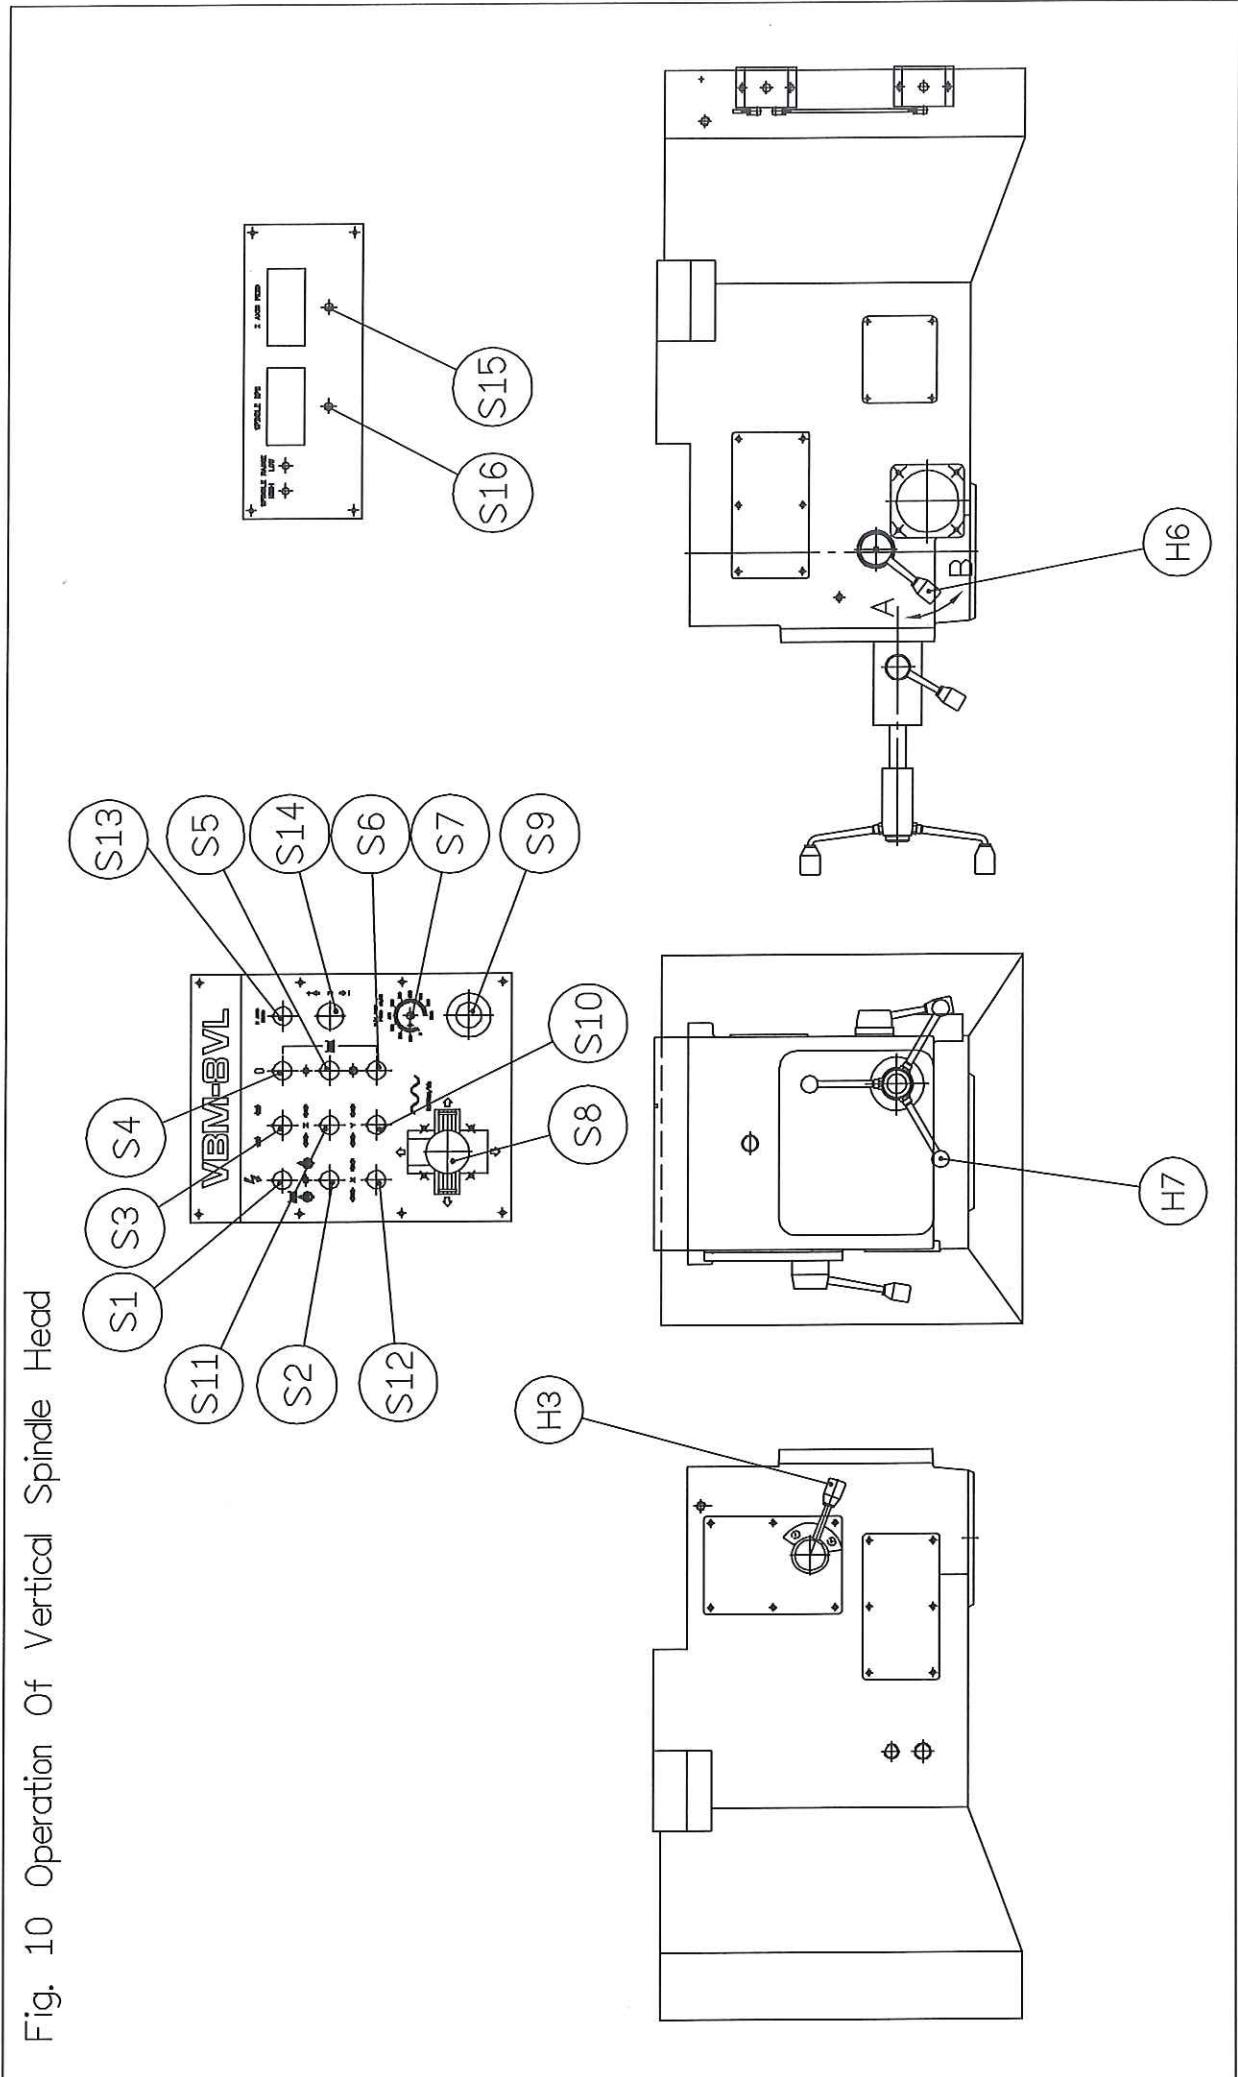

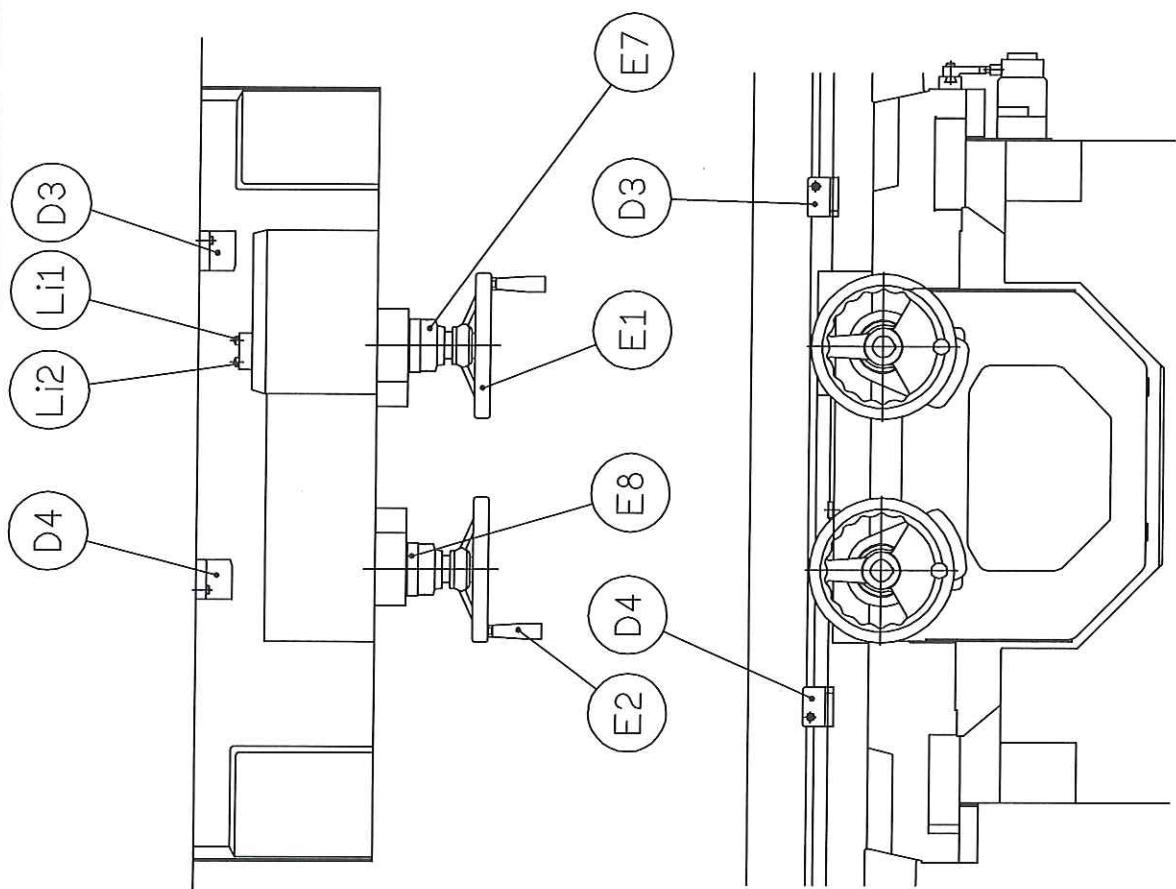

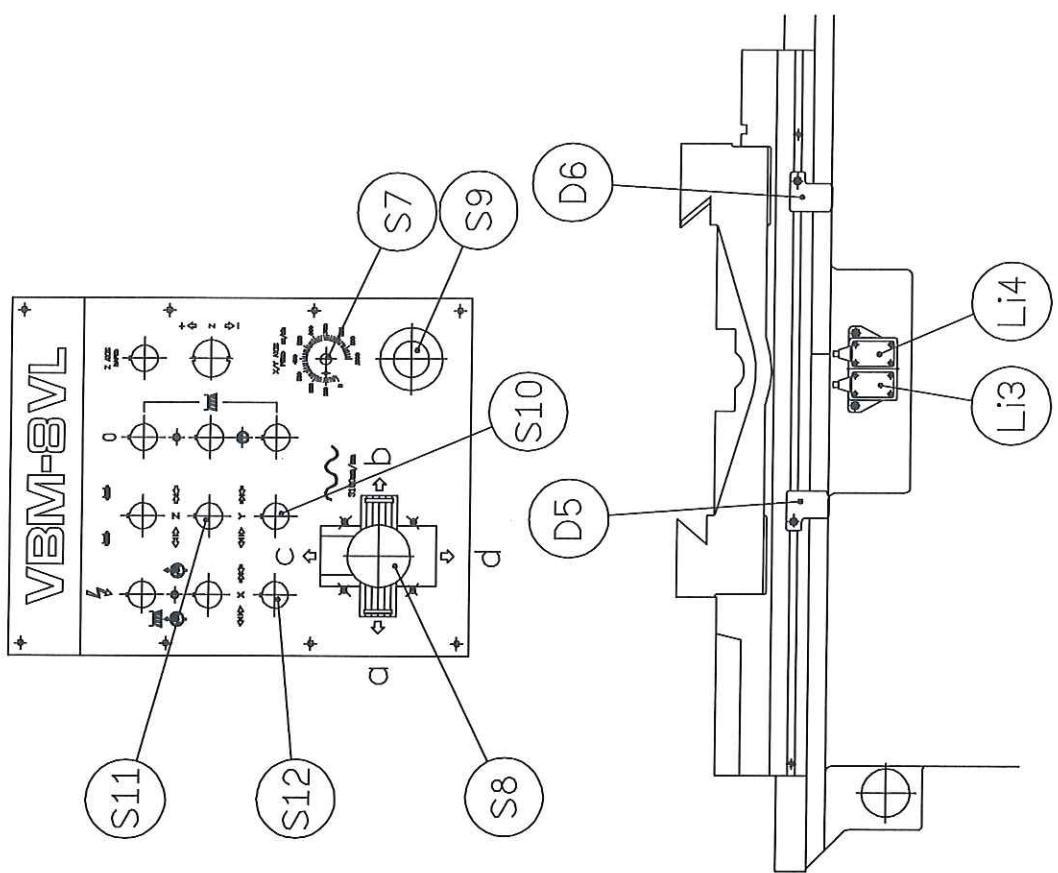

Fig. 11 Illustration Of Working Table and Saddle

7. Adjustment :

After installation of the machine or in operation, you find the condition of the machine is abnormal. The following steps should be taken. (Inspection or adjustment).

7-1. The level adjustment of the machine (Fig. 12)

1. Place the two levels of 0.02-0.05mm/1000mm accuracy on the table perpendicular to each other.
2. Loosen the nuts (A1) of anchor bolts (A2).
3. Loosen the leveling fixed nuts (L3).
4. Loosen the leveling bolts (L2) and adjust the level (10 leveling bolts to be adjusted) . Until the leveling is accurate.
5. Looking the leveling and fixed nuts (L3) (don't rotate the leveling bolts) .
6. Lock the anchor bolts with nuts (A1) .
7. Recheck the air bubbles displacement on the level

7-2. Adjustment Of vertical Spindle (Fig. 13)

If you find loose spindle or temperature rise of spindle bearing. The readjustment should be taken carefully.

1. Take apart the cover of spindle head (HC1).
2. Loosen the fixed bolts (B1).
3. Screwing the adjustable nuts (N1) not so loose, not so tight (because of temperature rise of bearing).
4. Screwing the fixed bolts (B1), (Preventing the adjusted nuts (N1) loose).
5. Reassembling the spindle head cover.

7-3. Adjustment Of Sliding Surfaces Of Gib. (Fig. 14, Fig. 15)

When sliding surfaces are loose, make a suitable adjustment.

A. Adjustment of side gib of vertical spindle head (Fig. 14)

1. Screw the bolts (K2) to adjust the inside gibs (K1).
2. Try to ascend and descend the spindle head and observe the tightness.

B. Adjustment of gib inside of vertical spindle head (Fig. 14)

1. Tighten the locking bolts (K6).
2. Screw the bolts (K4) to adjust the inside gibs (K3).
3. Try to ascend and descend the spindle head and observe the tightness.

C. Adjustment of gib for table (Fig. 15)

1. Loosen the locking nuts (KT3).
2. Screw the lock bolts (KT2) to adjust the gib (KT1)
3. Tighten the lock nuts (KT3).
4. Try to swing the table and observe the tightness.

D. Adjustment of gib for saddle (Fig. 15)

1. Loosen the locking nuts (KT7).
2. Screw the locking bolts (KT6) to adjust the gib (KT5)
3. Tighten all of the locking nuts (KT7).
4. Try to swing the saddle and observe the tightness.
